Summary

Senior iOS Engineer with 7+ years building software (iOS since 2021), working on large-scale apps in multicultural teams, with daily communication in English. Focused on performance, architecture, modularization, and testing, with full ownership of the software development lifecycle (SDLC). High-agency profile: I drive technical decisions, code reviews, and deliveries autonomously, with experience as a tech lead and mentor to other developers. I use AI daily to move faster, while technical decisions and the quality of what ships stay with me.

Skills

Languages: Swift, Objective-C, Python, SQL, Bash
iOS: UIKit (View Code and Storyboard), SwiftUI, Swift Concurrency (async/await), Combine, GCD, Core Data, CallKit, MapKit, WKWebView, REST APIs, Accessibility (VoiceOver)
Architecture: MVVM, MVC, Clean Architecture, Clean Swift (VIP), Hexagonal Architecture, modularization, dependency injection
Testing & quality: Swift Testing, XCTest, Firebase Crashlytics and Analytics
CI/CD & tooling: GitHub Actions, Jenkins, Bitrise, Fastlane, SPM, CocoaPods, Tuist, XcodeGen, TestFlight, App Store Connect, Git/GitHub, Xcode, Figma
AI: Claude Code, GitHub Copilot, Codex
Spoken languages: Portuguese (native), English (advanced, daily professional use), Spanish (basic)

Experience

Jun 2026 – Oct 2026 | São Paulo, Brazil | Hybrid

iOS Software Engineer — Novibet

Social team of the Novibet app: a social network embedded in the product, built on a single localized codebase serving countries across Latin America and Europe. Daily collaboration in English with the product team in Greece, Kanban workflow.

- **Analytics:** designed and implemented the social area's analytics from scratch — from zero instrumented screens to 7 fully covered ones.
- **Testing:** introduced the team's first unit tests, with Swift Testing, in a module that previously had zero coverage.
- **Componentization:** built generic UI components that eliminated ~3,000 lines of duplicated code and became the starting point for a design system.
- **Product:** delivered new features and bug fixes end to end, from refinement with product to release.
- **Documentation:** wrote the company's iOS technical documentation — onboarding guides and process standards for new developers.
- **AI workflow:** built my own AI-assisted development workflow — Claude Code with custom plugins, skills and agents, integrated with Jira, Confluence, GitHub, Swagger and Slack — while keeping design, code review and every line shipped with me.
- **Stack:** Swift, UIKit, Storyboard, Swift Concurrency, Combine, Swift Testing, GitHub Actions.

Feb 2023 – Mar 2026 | São Paulo, Brazil | Hybrid

iOS Software Engineer — F1rst (Santander)

3 continuous years in Santander's business banking — the bank's apps for corporate clients: hired through NAVA (Feb 2023 – Jan 2024) and converted by F1rst, Santander's technology company (Feb 2024 – Mar 2026). Worked on the Digital Customer Service, Security and Global Enterprise teams — the bank's first global engineering team for business banking.

- **Leadership:** iOS Code Owner for the channel since Feb 2025 and Tech Lead (Multiplier — Chapter) on the global team since Oct 2025 — 1:1s with 4 developers, code reviews and architecture decisions.
- **Global Position:** a generic, white-label home for business banking — owned the entire iOS front of the product, made available to 13 Santander countries across Europe and the Americas, including the iOS/web bridge of the hybrid home, native screens in SwiftUI and the foundation on top of the global platform.
- **Security:** on the channel's Security squad, shipped features for user security, aligned with the bank's anti-fraud team — such as suspicious-call (CallKit) and flagged-transaction alerts, the Santander ID journeys and screenshot blocking on sensitive journeys.
- **MFA (Security Challenge):** internal framework built to authenticate the user during a journey whenever the anti-fraud team requests it. Owned the entire iOS front, from architecture to delivery, and presented the model to the whole channel: generic for any segment of the bank and, since its 2024 release, mandatory for every new journey requiring authentication, with zero incidents and zero crashes.
- **Facial Biometrics:** fully refactored the journeys (Unico, Unique and Aware SDKs), cutting the code by 40% with zero incidents after release, and stayed in charge of them, shipping new features on the new foundation.

- **Customer Support:** with the main task being to refactor the customer support home, I also delivered performance (the 5 backend calls, which ran one after another, became 3 in parallel + 2 dependent, making the screen faster), unit tests, removal of 90% of the legacy code and the centralization of support contacts on iOS — previously scattered across journeys, now a single source for the whole app. I also integrated an external vendor's SDK (DialMyApp) into the app, leading the technical meetings in English with the vendor's foreign team.
- **Modularization & testing:** built modules from scratch on the latest patterns of each context (from Clean Swift to Swift 6 with Swift Concurrency), with each one's modularization approach — CocoaPods and XcodeGen in the Brazil channel; SPM, Tuist and Maven on the global platform — always with full unit test coverage of the entire module.
- **Design System:** on my own initiative, led the formalization of the channel's Design System and the standardization of the development environment (Xcode, Ruby and Homebrew), scalable to other Santander countries.
- **Onboarding & documentation:** created the tech and new-hire onboarding that became the reference for technology areas across the bank, beyond business banking — including retail banking and other segments. Every delivery with technical and functional documentation, including BPMN flows.
- **Production & communication:** constant post-release monitoring in production (Firebase Crashlytics and Analytics), war rooms and crash analysis; led technical meetings in English with global teams.
- **Stack:** Swift 6, Swift Concurrency, SwiftUI, UIKit, WKWebView, GCD, Clean Swift (VIP), MVVM, Clean and Hexagonal Architecture, XCTest, Swift Testing, SPM, CocoaPods, Tuist, XcodeGen, GitHub Actions, Jenkins, Bitrise, Fastlane, Firebase Crashlytics and Analytics.

Feb 2024 – Nov 2024 | São Paulo, Brazil | Hybrid

iOS Instructor — iOS Lab

Part-time, in parallel with my role at Santander. Taught Swift and iOS development — Xcode practices, Apple's guidelines (HIG) and App Store publishing — in online and in-person classes for students ranging from beginners to developers switching stacks, balancing the course's certification goal with the reality of working as an iOS developer. Redesigned the syllabus around market-aligned topics, which became the school's reference, and built the teaching materials: slides, hands-on exercises and a final project in which each student shipped an app end to end.

Jan 2021 – Dec 2022 | São Paulo, Brazil | On-site

iOS Software Engineer — Apple Developer Academy | Mackenzie

Apple's program focused on development for the Apple ecosystem — coding, design and professional skills, including sessions held directly with Apple teams. Shipped 6 apps to the App Store, individually and in teams, on cycles from 2 weeks to 6 months, running the full cycle each time: research, design, architecture, development, usability testing and release — using only Apple frameworks, with no third-party dependencies.

- **Final project:** Tech Lead of the six-month team project (Hortali), driving technical decisions and team organization; the project took part in Apple Entrepreneur Camp.
- **Design & UI/UX:** created wireframes and interactive prototypes, validated through usability testing (recruiting, user interviews and sessions with experts), and design systems from scratch, applying research, benchmarking and Apple's Human Interface Guidelines (HIG).
- **Beyond iOS:** built for iPadOS, macOS, tvOS and watchOS, and wrote the REST backends (Python, Flask) the apps consumed.
- **Teaching:** gave internal classes on Git, Swift protocols and Collection View, and was the class's go-to reference for Git and GitHub.
- **Communication:** presented in Portuguese and English to Apple representatives, investors and partner companies.
- **Stack:** Swift, UIKit (View Code, adaptive layout, Storyboard), MVC, MVVM, Core Data, UserDefaults, MapKit, Photos, Contacts, REST APIs, Python (Flask), Git/GitHub, App Store Connect.

Oct 2019 – Dec 2019 | São Paulo, Brazil | On-site

IT Intern & Administrative Assistant — Maria Cacau

Internship at my family's business, a fine chocolate manufacturer, working mainly as an administrative assistant: creating and tracking orders. Seeing how much time the manual process took, I built an internal Python tool on my own initiative that organizes customer data for invoicing and generates the order summary for any period, aligning planning between the administrative and production areas. It was my first production software.

- **Still used by the company today:** after the internship, I kept maintaining and evolving the system on my own. Today it is MC Consultas, a desktop app the Maria Cacau team uses every day for production and delivery summaries, overdue-payment tracking and sending conversions to the Meta Conversions API.
- **A study ground beyond iOS:** Flask backend with feature-based Clean Architecture, a data layer optimized for the Google Sheets API quota, its own design system and CI/CD with GitHub Actions that builds and publishes the releases.
- **Stack:** Python, PyQt6, Flask, Google Sheets API, Meta Conversions API, GitHub Actions.

Education

Jan 2019 – Dec 2022 | São Paulo, Brazil

Bachelor's in Computer Science — Mackenzie Presbyterian University

- **Thesis:** "Analysis and application of code optimization techniques" — a year studying performance gains, resulting in a paper with the techniques applied to two real projects: Catch Fly, a game I published on the App Store during the Apple Developer Academy, and a Python application with C.
- **Undergraduate research (Iniciação Tecnológica):** learning paths and blended learning, focused on documentation and on Apple's Challenge Based Learning (CBL) methodology; the result was a macOS app that organizes the student's documents and grades.
- **MackLeaps:** volunteered for 1 year at the university's software development lab.
