São Paulo  Brazil  +55 11 92680-2983  gui.sreis25@gmail.com
github.com/Gui25Reis  linkedin.com/in/guilherme-santiago-reis

iOS Software Engineer with 7+ years of experience (5+ in Swift), working on large-scale apps in multicultural teams, with daily communication in English. Focused on performance, architecture, modularization, and testing, with full ownership of the software development lifecycle (SDLC). High-agency profile: I drive technical decisions, code reviews, and deliveries autonomously, and also act as a tech lead and mentor to other developers. I use AI as a tool to boost productivity and quality.

- UIKit & SwiftUI
 - View Code & Storyboard
 - Swift Testing & XCTest
 - CoreData, CallKit, Combine
- MVVM
 - MVC
 - Clean Architecture
 - Clean Swift
- Claude
 - Copilot
 - Codex
 - Devin
- SPM
 - CocoaPods
 - Tuist
 - XcodeGen
- Swift
 - Python & Flask
 - Bash
 - SQL - MySQL
- Git & GitHub
 - Xcode
 - Figma
 - Firebase
- Portuguese: native
 - English: advanced, used daily at work
 - Spanish: basic

2026 - present | São Paulo, Brazil | Hybrid

iOS Software Engineer Novibet

I work on the Social team, responsible for the social network integrated into the Novibet app, a single, localized codebase serving multiple countries. Daily meetings in English with the product team, based in Greece, following a Kanban workflow.

- Implemented the area's analytics from scratch.
- Introduced the first unit tests using Swift Testing, where there was previously no coverage.
- Built generic components that eliminated code duplication and serve as the foundation for a design system.
- Develop new features and fix bugs, maintaining and evolving the product after its initial release.
- Contribute to the company's technical documentation, including onboarding and the standardization of iOS processes, helping new developers ramp up.
- Set up an AI workspace (Claude Code) with project context and reusable skills, supporting new task kick-offs, solution design, and code reviews, integrated with Jira, Confluence, GitHub, Slack, and Swagger.

2023 - 2026 | São Paulo, Brazil | Hybrid

iOS Software Engineer F1rst (Santander)

I worked on the Customer Support, Security, and Global Enterprise teams of the business (PJ) channel, building and evolving the Santander Empresas app at scale.

- Owned the entire iOS front of the centralized MFA module (Security Challenge), from architecture to delivery, now mandatory in every journey of the channel that requires authentication and reusable by other channels.
- Fully refactored the Facial Biometrics journeys (Unico, Unique, and Aware SDKs), reducing the code by 40% with no incidents after release.
- On the Global Enterprise team, Santander's first Global PJ team, owned the entire iOS front of Global Position, a white label home reusable across the group's countries, with the technical foundation aligned with the global platform team.
- Delivered every task with my own architectural design, 100% unit test coverage (including global projects), and technical and functional documentation, following the channel's established standards.
- Led performance improvements (concurrency, parallelism, and memory), the resolution of legacy technical debt, and the creation of generic components and modules for reuse across the channel.
- Acted as Multiplier (Tech Lead) and Code Owner, with 1:1s, code reviews, PR approvals, and architectural decisions.
- Took part in incident rooms and the resolution of critical production incidents and crashes, including log analysis.
- On my own initiative, led the formalization of the Design System for the PJ channel and the standardization of the development environment (Xcode, Ruby, and Homebrew), with a scalable solution for Brazil and other countries in the group.
- Documented the company's iOS onboarding, BPMN flows, and technical decisions, led meetings in English with global teams, and built automation scripts for recurring project setup.
- Tools and technologies: CI/CD with GitHub Actions, Jenkins, Bitrise, and Fastlane; modularization with SPM, CocoaPods, Tuist, XcodeGen, and Maven; Clean Swift, MVVM, MVC, Hexagonal, and Clean Architecture; observability with Firebase Crashlytics and Analytics.

2024 | São Paulo, Brazil | Hybrid

iOS Instructor iOS Lab

I taught Swift and iOS development, covering Xcode practices, Apple's guidelines (HIG), and App Store publishing, in online and in-person classes for students ranging from beginners to professionals transitioning from other languages. I redesigned the course syllabus with market-aligned topics, which became the school's reference, and created the teaching materials, with slides, hands-on exercises, and a final project in which students built an app from start to finish.

2021 - 2022 | São Paulo, Brazil | On-site

iOS Developer Apple Developer Academy Mackenzie

Apple's training program focused on native iOS development, following Apple's design and programming guidelines. 8 apps published on the App Store, in individual and team projects, covering the full software development lifecycle (SDLC), from ideation to release.

- Developed using only Apple's frameworks and technologies, with no external dependencies.
- Worked on the design side of the projects, creating navigable prototypes and defining UI/UX based on the Human Interface Guidelines (HIG) at every stage, and ran usability tests with users and domain experts.
- Acted as Tech Lead on the six-month final project (Hortali) and on other projects, driving technical decisions and team organization.
- Gave presentations in Portuguese and English to internal members, Apple representatives, investors, and partner companies.
- Was the go-to reference for Git and GitHub within the teams and taught classes on Swift protocols and Collection View.
- Tools and technologies: iOS, iPadOS, macOS, tvOS, and watchOS; View Code and adaptive layout with UIKit; MVC and MVVM; MapKit, CoreData, UserDefaults, Contacts, and PhotosUI; API development in Python (Flask) and REST API consumption.

2019 - 2022 | São Paulo, Brazil

B.Sc. in Computer Science Universidade Presbiteriana Mackenzie

- Thesis on code optimization techniques for performance gains.
- Undergraduate research focused on documentation and personalized teaching.
- Volunteered for 1 year at MackLeaps, the university's software development lab.

2025

Global Position • Santander Global Enterprise

White label home of the Empresas app for the Global PJ context, delivered by Santander's first Global PJ team: a single product, with ready-made components and structure, that each country adopts and configures, centralizing technical responsibility in one team and avoiding duplicated code and resources per country. I owned the entire iOS front of the hybrid product, including the native bridge, with the technical foundation aligned with the global platform team. I mapped the as-is scenarios and other countries' integrations to anticipate issues, contributed to global structural libraries, and documented the global technical layer. Delivered with 100% test coverage, in Swift 6, SwiftUI, UIKit, and Clean Architecture.

2024

MFA - Security Challenge • Santander Empresas

Centralized module for handling the app's internal authentication challenges, enabling MFA in a journey whenever needed. I owned the entire iOS front and part of the business rules, analyzing the behavior of existing journeys to design a solution that covered every case, with the orchestration of authentication factors in a single point. Built channel-agnostic, using core iOS design patterns, for reuse by other areas. I presented how it works and its model to the whole channel, making its use official, and the module became mandatory in every journey that requires authentication, with no production incidents after release.

2022

Hortali • Apple Developer Academy | Mackenzie

Academy final project with a social theme, addressing food insecurity. The app maps community and urban gardens across Greater São Paulo and provides information about foods, such as vitamins, benefits, and harvest season, to help people facing or at risk of facing this issue. In a team of 6, I acted as Tech Lead, defining the style guide and technical standards, with PR reviews, documentation, and internal coding classes, and took part in every stage alongside the team. Open source project, taken to the Apple Entrepreneur Camp.

2020 - present

MC Consultas • Maria Cacau

Internal order management system, used daily by the team since its creation. Desktop app in Python (PyQt6) that generates production and delivery summaries, tracks overdue payments, and sends conversions to the Meta Conversions API to track sales originating from ads. I built and maintain the entire ecosystem on my own, and use the project as a learning ground beyond iOS: in-process Flask backend with feature-based Clean Architecture, a data layer optimized for the Google Sheets API quota, a custom design system, and CI/CD with GitHub Actions that builds and publishes the releases.
